

Global Governance

The International Problem

AI is global; governance is national

- Companies can relocate to avoid regulation
- Countries compete for AI investment (race to bottom)
- Different standards create compliance burden
- US-China competition reduces safety cooperation

Current Mechanisms

- OECD AI Principles - Non-binding recommendations
- UN discussions - Slow, no enforcement
- Sectoral agreements - Limited (e.g., autonomous weapons talks stalled)

Proposed Solutions

- International AI Agency (like nuclear IAEA)
 - Set standards, inspect, verify
 - Challenge: Sovereignty concerns, who controls it?

Proposed Solutions

- AI Safety Treaty
 - Binding minimum standards
 - Challenge: Getting agreement, verification

[illegible]

- Multi-stakeholder Governance
 - Include companies, governments, civil society
 - Challenge: Power imbalances, unclear accountability

The Democratic Deficit

Key concern: AI governance happening without democratic input

Problems:

- Technical complexity excludes public participation
- Decisions made by engineers, executives, regulators
- Affected communities not at table
- Global impacts, national/corporate decision-making

Proposed Solutions

Citizen assemblies on AI:

- Randomly selected citizens
- Educated on issues
- Deliberate and make recommendations
- Examples: UK, Denmark experimenting

A stylized illustration of a globe with various icons representing different sectors like education, healthcare, and technology, connected by a network of lines, symbolizing global connectivity and the impact of AI. The globe is centered on the Atlantic Ocean, with North and South America visible. It is surrounded by a network of dashed and solid lines in various colors (blue, red, green, yellow) that connect to numerous circular icons. These icons include symbols for a graduation cap, a microscope, a house, a bar chart, a smartphone, a person, a gear, a document, and a network of nodes. The background is a light blue gradient with some abstract white lines in the corners.

Citizen assemblies on AI:

- Randomly selected citizens
- Educated on issues
- Deliberate and make recommendations
- Examples: UK, Denmark experimenting

Proposed Solutions

Participatory technology assessment:

- Public consultation in technology development
- Upstream engagement (before deployment)
- Challenges: Meaningful vs. performative participation

Proposed Solutions

Democratic oversight of AI companies:

- Worker representation on boards
- User councils with real power
- Public benefit corporation structures

A stylized illustration of a globe with various icons representing different sectors (education, healthcare, industry, etc.) connected by lines, symbolizing global connectivity and the impact of AI. The globe is centered on the Atlantic Ocean, with North and South America visible. It is surrounded by a network of colorful lines and circular icons, each containing a symbol for a different field: a graduation cap for education, a heart for healthcare, a factory for industry, a person for social issues, and a bar chart for economics. The background is a light blue gradient with decorative wavy lines in the corners.

Democratic oversight of AI companies:

- Worker representation on boards
- User councils with real power
- Public benefit corporation structures
