

WHY ETHICS MATTER

TECHNOLOGY VS DECISION SYSTEMS

Traditional technology:

- Executes human decisions

AI systems:

- Shape, recommend, or automate decisions
- Influence outcomes at scale
- Operate with limited human review

Key shift:

From **tools** to **decision infrastructures**

DELEGATION OF JUDGEMENT

- Humans delegate judgment to AI systems
- Decisions are increasingly:
 - Pre-filtered
 - Ranked
 - Scored
- Humans often trust AI outputs by default

Ethical question:
When is it acceptable to delegate judgment?

SCALE CHANGES ETHICS

- One AI decision can affect:
 - Thousands
 - Millions
 - Entire populations
- Errors scale instantly
- Bias becomes systemic

Ethical implication:
Small design choices can cause widespread harm.

SPEED REDUCES REFLECTION

- AI systems operate continuously
- Decisions occur faster than human oversight
- Limited time to question or intervene

Result:
Ethical review is often bypassed in practice.

OPACITY CREATES ACCOUNTABILITY GAPS

- AI decisions may not be explainable
- Responsibility is distributed across:
 - Developers
 - Organizations
 - Vendors
- Harm occurs without clear ownership

Core issue:

Who is accountable when no one fully understands the system?

HARM WITHOUT INTENT

- AI systems do not intend harm
- Harm can still occur through:
 - Biased data
 - Misaligned objectives
 - Unintended correlations

Ethical shift:
From intent-based ethics to impact-based ethics

WHY ETHICS CANNOT BE OPTIONAL

- Legal systems are reactive
- Compliance focuses on minimum standards
- Ethical failures often occur before regulation

Conclusion:

Ethics must guide AI before deployment, not after harm.

ETHICS AS RISK PREVENTION

AI ethics helps:

- Identify foreseeable harms
- Anticipate misuse
- Balance competing values
- Protect vulnerable groups

Ethics is risk intelligence.

ETHICS ISN'T ABOUT PERFECTION

- No AI system is risk-free
- Ethical decisions involve trade-offs
- Reasoned judgment matters more than “right answers”

WHAT THIS MEANS FOR YOU ...

- If you design, deploy, or manage AI:
 - You influence outcomes
 - You share responsibility
 - Ethical awareness is part of professional competence

SUMMARY

- AI changes how decisions are made
- Scale, speed, and opacity increase ethical risk
- Harm can occur without malicious intent
- Ethics is essential to responsible AI use

REFLECTION QUESTIONS

- When should judgment not be delegated to AI?
- Is impact more important than intent?
- Who should be accountable for AI-driven harm?
